1 Literature Review and Evaluation

1.1 Literature Review

Recent advancements in NLU and transformer models such as BERT have significantly improved intent classification and entity extraction tasks. while modern systems use machine learning to provide flexible interaction. This project adopts a multi-task learning approach to improve efficiency and scalability.

1.2 Feedback and Evaluation

The project will be evaluated based on system performance, usability, and integration quality. Feedback will focus on model accuracy, backend efficiency, and overall system design.

1.3 Final Grading Criteria

- Documentation quality
- Implementation completeness
- Model performance
- Testing results
- Presentation quality
